Brief overview of remote sensing and GIS works of VITUKI

Béla Licskó VITUKI Non-profit Ltd.

ChangeHabitats2

RS and GIS works in VITUKI

1960s: Hydrograph maps production

1970s: Complex projects

Hydrogeological investigations and mapping Survey of bank filtration zones of Danube and Lake Balaton Elaboration of methodologies supporting the water management

1980s: Multispectral and satellite remote sensing

Interkozmos program

Coloured infra and multiband (screened) air-photos

Practical guide books

1990s: Complex applications

Video remote sensing

Digital image processing GIS

2000s: Digital techniques

1. Film scanning; 2. digital survey, computer aided image processing; linkage RS and GIS (+GPS)

Application areas

- <u>3 water quality parameter map of Lake</u>: Total suspended solid, "A" chlorophyll, dissolved organic matter - Landsat TM survey and site sampling.
- <u>Photo maps of water resources:</u> georeferenced images and transformation of them to EOV projection.
- <u>Remote sensing works to support amelioration activities</u>
- <u>Mapping of reeds of Lake Velence and Lake Balaton</u>
- Making air-born photos on selected NATURA 2000 areas
- <u>Video remote sensing of forests of Bükk and Aggtelek</u> <u>National Parks</u> (In collaboration with Sylvacam, Finland)

Projects related to NATURA 2000

Mapping of water bodies

Flood inundations Excess water inundation Surface water temperature

Land use / Land cover mapping

Priming and impact studies Occasional Multi temporal

Habitat sites mapping

Remote sensing – Botanic – Zoology - GIS

High resolution digital air-born photography

ChangeHabitats2

Flooding and excess water mapping

ChangeHabitats2

Inundation occurred as a consequence of flood levee breaches during the Upper-Tisza flood in 2001. The propagation of inundation was followed by daily / every other day air-borne photography and immediate subsequent data processing, which provided valuable information for operative flood protection management. These time series kind inundation maps could be utilized in calibration of hydrological, hydraulic models.

Areas after the dual flood levee breaches on 7 - 8 March 2001

The inundated area on 9 March 2001

ChangeHabitats2

The total area inundated by the flood (7-13 March 2001)

Air-born photo of Gulács village at the time of peak inundation

ChangeHabitats2

Production of digital maps of years 1999 and 2000 excess drainage water inundation

Extraordinary excess water inundations happened in the Tisza Valley in 1999 and 2000. The inundated areas were surveyed using air-borne digital photos. With the interpretation of photo maps the open water surfaces and areas with saturated soils were delineated. Digital maps on excess water inundations were made for about 11.000 km2.

Land use / Land cover mapping

ChangeHabitats2

Coloured and infra air-borne survey was carried out to detect the changes of the Szigetköz area. The images were processed to delineate 12 land cover category areas on a M=1:10.000 EOTR map. These land cover maps were produced in Arc View format as well.

Air-borne survey of the site area (36 km2) using colour and infra colour photos with stereo overlapping. Digital orthophoto map production at a scale of 1:10.000 to EOV map base. Delineation of land cover categories. Digital maps production for 13 categories. Change detections.

BÁTAAPÁTI-ÜVEGHUTA (A TELEPHELY KÖRNYEZETE)

ChangeHabitats2

BÁTAAPÁTI-ÜVEGHUTA (A TELEPHELY KÖRNYEZETE) ORTOFOTÓ (CIR)

ChangeHabitats2

BÁTAAPÁTI-ÜVEGHUTA (A TELEPHELY KÖRNYEZETE) TERÜLETHASZNÁLATI TÉRKÉP

Detection of changes in land cover between 1998 and 2003.

ChangeHabitats2

Preparation of surface and air-borne panorama photos of waste dump site from different view points. Digital elevation model results at 4 different fill up level of the waste dump site using shading technology, real and 2 times vertical distortion versions.

Production of 3D visual images using air-borne remote sensing images which were combined with undistorted model results.

Undistorted digital elevation model result after the waste dump site is fully filled up

ChangeHabitats2

Mapping of surface temperature distribution

ChangeHabitats2

Hévíz Lake

The reference air-borne image of the Hévízi Lake with the measurement points

ChangeHabitats2

The surface temperature image of the Hévízi Lake (temperature distribution) 4 April 2002.

ChangeHabitats2

Investigation of mixing zone in the Danube at Paks Nuclear Power Plant cooling channel

Mapping of the warm water plume in the cooling channel of the Power Plant at different Danube water temperature conditions.

Production of digital temperature maps of the investigated river section at scale M=1:5.000.

Temperature distribution survey of the Danube river between Paks and the South National Border line, and production of M=1:25.000 scale digital temperature distribution map.

Investigation of the Danube River below Paks with air-borne thermovison camera

THE TERMOVISION CAMERA

ChangeHabitats2

Transformed air-borne and thermo images about the river below warm-water channel

ChangeHabitats2

Investigation of Danube River below Paks using air-borne thermovision images

10. <u>Result of survey in 2003</u>

Survey on 13 Feb 2003 (when 4 block were in operation

Water level of Danube at Paks gauging station 195 cm, discharge 2150 m³/s, water temperature 0,7 C.

Water level: mean water level (208 cm).

Discharge: mean discharge (2199 m³/s).

ChangeHabitats2

Habitat site mapping and interactive presentation

Investigation of Nordic Meadow Mouse with GIS system

DIGITAL, HIGH RESOLUTION AIRBORNE SURVEY

Halásztelek digital photomap (area resolution is 10 cm)
